Screenshots Advertisement Reviews 5 stars I'm happy to see that you didn't remove the serial key from your site and only kept a link to it. I've used this in the past. It does a great job. I've never been able to get it to work with any WEP networks. Maybe that's my fault because I've always been using Ip's and such from the router. What's new I've made this a freeware program. You can't sell the serial number, but I've given you the option to either email me or send me a check if you want to, but I'm the only one who has access to this program. I just wanted to keep it a freeware program. I also wanted to point out that I am adding WPA2 support. This program is designed to be the only tool you'll ever need to crack any WPA/WPA2 password. If you don't feel comfortable with checking whether you can get a particular wifi network to connect with using a packet sniffer, then you can simply launch the program, connect to the wifi and select that wifi network. The program will check if that wifi network is using WPA/WPA2 and crack it for you. The software will automatically set up the correct credentials for you. There's really no learning curve to this program. It's designed to do just what it does. It's also fairly easy to use. I've designed it to be so that you can just do a right click and select "connect to" and it will connect to the wifi network that you selected. You then just type in the wifi name, password and security method. I've made the interface look a little different and the tabs will help you in accessing everything more quickly. While I'm making it a freeware program, there's a couple of paid features that I've added. * The first paid feature is that you can modify a saved network and save the settings to a file. This means you can make it so that

it will connect to the same network every time you boot your system. * The second paid feature is a tab on 82157476af
